ReclaimKit — Quick Start

Remove harmful social content and search results using privacy erasure requests.

1. Install

```
git clone https://github.com/tgollogly/ReclaimKit.git
cd ReclaimKit
pip install -r requirements.txt
python3 main.py init
```

2. Configure

Edit `config.yaml` — your name, email, country, and `jurisdiction` block (privacy law + regulator for your country).

Copy screenshots → `evidence/screenshots/`

3. Test

```
python3 main.py campaign init
python3 main.py doctor
python3 main.py daemon once --dry-run
python3 -m pytest tests/ -v
./scripts/check-autosave.sh
```

4. Deploy (Docker)

```
cd deploy && docker compose up -d --build
docker compose ps
```

5. Email platform privacy team

Open `output/campaign-package-.../round-01-meta/meta_r1_erasure_initial.txt`

Email **privacy@facebook.com** with screenshots, then:

```
docker compose run --rm reclaimkit python3 main.py campaign sent --track meta --round 1
```

6. Optional VPS

See [deploy/VPS-GUIDE.md](#) (~\$5/mo for 24/7 automation).

Doc	Purpose
README.md	Test & deploy all platforms
WINDOWS-WSL-DOCKER.md	Windows setup
AUTO-EMAIL-SETUP.md	Optional auto-send

```
./scripts/audit.sh    # full repo check
```

Not legal advice. Copyright © 2026 [tgollogly](#) — [MIT License](#). Configure `jurisdiction` in config.yaml for your country's privacy law.
