

ReclaimKit - Windows WSL Docker

ReclaimKit contributors

Windows 11 — WSL2 + Docker (automated test)

Run ReclaimKit in **WSL2** with **Docker Desktop** — daily automation, auto-save, optional auto-email.

Do not paste `git clone`, `chmod`, or `sudo apt` **into PowerShell** — they only work in Ubuntu/Linux.

Quick setup (PowerShell)

1. Docker Desktop open and **Running**
2. Paste **one** of these in PowerShell (`PS C:\...>`):

```
irm https://raw.githubusercontent.com/tgollogly/ReclaimKit/main/scripts/setup-windows.ps1 | iex
```

Or:

```
wsl -d Ubuntu bash -c "sudo apt update && sudo apt install -y git && rm -rf ~/reclaimkit && git clone https://github.com/tgollogly/reclaimkit.git ~/reclaimkit && cd ~/reclaimkit && chmod +x scripts/wsl-setup-and-test.sh && ./scripts/wsl-setup-and-test.sh"
```

Pass = **SETUP COMPLETE** .

Part 1 — One-time setup (Windows)

1. Install WSL2

PowerShell as Administrator:

```
wsl --install
```

Restart if asked. Ubuntu is the default Linux.

2. Install Docker Desktop

1. Download: <https://www.docker.com/products/docker-desktop/>
2. Install and open Docker Desktop
3. **Settings** → **General** → enable **Use the WSL 2 based engine**
4. **Settings** → **Resources** → **WSL Integration** → enable **Ubuntu**
5. Wait until Docker Desktop says **Running**

3. Open Ubuntu (WSL)

Start menu → **Ubuntu**, or PowerShell:

```
wsl
```

You should see a Linux prompt like `username@PC:~$`

Part 2 — One script setup + test (WSL)

Your prompt must look like `username@PC:~$` — not `PS C:\Users\User>` .

Easiest: use the PowerShell one-liner in [Quick setup](#) above.

Manual: open **Ubuntu** from Start menu, then paste:

```
sudo apt update && sudo apt install -y git
rm -rf ~/reclaimkit
git clone https://github.com/tgollogly/reclaimkit.git ~/reclaimkit
cd ~/reclaimkit
chmod +x scripts/wsl-setup-and-test.sh
./scripts/wsl-setup-and-test.sh
```

The script will:

1. Check Docker is running
2. Create `config.yaml` from template
3. Build the Docker image
4. Run `doctor` (health check)
5. Run `campaign init` (generate Round 1 letters)
6. Run `daemon once --dry-run` (safe automation test)
7. Start the container (daily cron at 08:00 UTC)

Expected end message: `SETUP COMPLETE`

Part 3 — Configure before emailing Meta

Still in WSL:

```
nano ~/reclaimkit/config.yaml
```

Save in nano: `Ctrl+X → Y → Enter`

Fill in:

- Real **email, address, phone**
- `post_origin`: `uncertain` (safest if unsure who posted)
- `meta_reports` (your Meta rejection details)

Add screenshots (from Windows you can copy to):

```
\\wsl$\\Ubuntu\\home\\YOUR_USERNAME\\reclaimkit\\evidence\\screenshots\\
```

Or in WSL:

```
cp /mnt/c/Users/User/Pictures/your-screenshot.png ~/reclaimkit/evidence/screenshots/
```

Regenerate letters after config change:

```
cd ~/reclaimkit/deploy
docker compose run --rm reclaimkit python3 main.py campaign init
```

Part 4 — Email Meta + record send

1. Open letter (from Windows Explorer or WSL):

```
~/reclaimkit/output/campaign-package-.../round-01-meta/meta_r1_gdpr_initial.txt
```

2. Email **privacy@facebook.com** with screenshots attached

3. Record in ReclaimKit:

```
cd ~/reclaimkit/deploy
docker compose run --rm reclaimkit python3 main.py campaign sent --track meta --round 1
```

Part 5 — Enable auto-email (optional, free Gmail)

See [AUTO-EMAIL-SETUP.md](#)

Quick version in WSL:

```
cd ~/reclaimkit
cp .env.example .env
nano .env # RECLAIMKIT_SMTP_PASSWORD=your-gmail-app-password
nano config.yaml # auto_send_emails: true, smtp.enabled: true
```

Uncomment in `deploy/docker-compose.yml` :

```
env_file:
- ../.env
```

Restart:

```
cd ~/reclaimkit/deploy
docker compose down && docker compose up -d --build
```

Daily commands (WSL)

All from `~/reclaimkit/deploy` :

Task	Command
Check status	<code>docker compose run --rm reclaimkit python3 main.py campaign status</code>
View logs	<code>docker compose logs -f</code>
Cron log file	<code>cat ../output/cron.log</code>
Test automation (safe)	<code>docker compose run --rm reclaimkit python3 main.py daemon once --dry-run</code>
Run automation now	<code>docker compose run --rm reclaimkit python3 main.py daemon once</code>
Stop container	<code>docker compose down</code>
Start again	<code>docker compose up -d</code>

Doctor vs Docker

	doctor	Docker
What	Health check	Runs daily automation
Command	<code>docker compose run --rm reclaimkit python3 main.py doctor</code>	<code>docker compose up -d</code>
Auto-save	No	Yes — <code>output/</code> folder on your disk

Troubleshooting

Problem	Fix
Docker daemon not running	Start Docker Desktop on Windows
<code>wsl: command not found</code>	Run <code>wsl --install</code> , restart
Cannot connect to Docker	Docker Desktop → WSL Integration → Ubuntu ON
Doctor warns no screenshots	Add PNG/JPG to <code>evidence/screenshots/</code>
Cron not running yet	Runs daily 08:00 UTC — or run <code>daemon</code> once manually
Slow on <code>/mnt/c/</code>	Clone in <code>~/reclaimkit</code> (Linux home), not <code>C:\</code>

Undo everything (WSL)

```
cd ~/reclaimkit/deploy
docker compose down
cd ~
rm -rf ~/reclaimkit
```

PDF guides

After clone, open in Windows:

- `\\wsl$\\Ubuntu\\home\\YOUR_USERNAME\\reclaimkit\\docs\\QUICK-START.pdf`
- `docs\\COMPLETE-GUIDE.pdf`
- `docs\\AUTO-EMAIL-SETUP.pdf`
