

ReclaimKit - Complete User Guide

ReclaimKit contributors

ReclaimKit — Complete User Guide

Everything you need to know and do to remove harmful Facebook content, delist from Google, and close your account.

Field	Details
For	Anyone removing harmful social content
Toolkit	ReclaimKit
Version	August 2026
Legal basis	Configurable — set <code>jurisdiction</code> in <code>config.yaml</code> for your country's privacy law

Note: For the latest test/deploy steps, see [README.md](#). This guide provides extended detail.

Disclaimer: ReclaimKit generates templates and tracks your campaign. It is **not legal advice** and is not affiliated with Meta, Google, or any paid removal service. Platform decisions are theirs; this guide helps you use official channels reputation firms use.

Table of contents

1. Will this work?

Yes — this is a proven, legitimate process. Paid reputation firms (Removify, Erase.com, etc.) charge **£400-£2,000 per item** to submit the **same** GDPR emails, Meta escalation forms, and Google delisting requests that ReclaimKit generates for you.

What ReclaimKit does

Capability	Details
6-round Meta escalation	Privacy initial, then reminder, Trust & Safety, rebuttal, regulator notice, post-regulator
3-round Google delisting	Defamation, then personal info, then resubmit with case history
1 regulator complaint letter	Free authority pressure if Meta refuses after the response deadline
Evidence pack	Hashed screenshots + case summary for attachments
Search monitoring	Scans public web for indexed mentions of your name
Image search	Optional daily reverse-image scan (SerpAPI/TinEye)
Slack alerts	Notifies you when new harmful URLs appear
VPS automation	Daily monitor + optional auto-email to Meta (~£5/month)

What no software can do

Limitation	Why
Instant deletion	Only Meta can remove Facebook posts — there is no public delete API
Auto-submit Google forms	Google has no API; you paste letter text into their web forms (~2 min each)
Scrape private groups	Illegal / against ToS; ReclaimKit uses your saved URL and screenshots
Guarantee removal	Platforms decide; persistence and proper legal framing improve success
Deanonymize commenters	Meta will not reveal identities without legal disclosure

Realistic expectation: Platforms must respond within the deadline set by your jurisdiction (often **30 days**). Many cases resolve in Round 1–3. If the platform refuses, regulator complaints are free and often effective. Google delisting hides content from search even if a copy exists elsewhere.

2. Example case (fill in your own details in config.yaml)

Field	Example placeholder
Your name	Set in <code>config.yaml</code> → <code>subject.full_name</code>
Location	Set in <code>config.yaml</code> → <code>subject.country</code>
Harmful content	Facebook group post with your photo + false allegations
Group	Set in <code>config.yaml</code> → <code>case.facebook.group_name</code>
Post URL	Set in <code>config.yaml</code> → <code>case.facebook.post_url</code>
Already reported in-app?	Set <code>reported_to_meta: true</code> if applicable

Alleged commenters

Add handles to `config.yaml` → `case.alleged_commenters`. ReclaimKit **cannot** identify real people behind anonymous names — only the platform can, via legal process.

Example:

```
alleged_commenters:
- display_name: "ExampleUser1"
  comment: "Example harmful comment"
  posted_approx: "date unknown"
```

3. What you need before you start

Required (you almost certainly have these)

Item	Used for
Your real email address	Sending GDPR requests; Meta replies here
Postal address	Identity verification in letters (name + address)
Full legal name	As it appears on the harmful content
Screenshots	Post, comments, your photo — saved locally
Post URL	Set in <code>config.yaml</code> after <code>init</code>
A computer	Windows 11, Mac, or Linux

Helpful but optional

Item	Used for
Phone number	Included in letters; Meta may contact you
Passport / ID	Not sent upfront. Meta may ask later to verify identity
Slack webhook	Daily alerts when new URLs appear
VPS (~£5/month)	Hands-off daily monitoring
SerpAPI or TinEye key	Daily reverse-image search

Not required

Item	Notes
Facebook password long-term	GDPR runs on email; see Section 4
Solicitor	Only if platform + regulator both fail
Police report	Your chosen path avoids this
Payment to Removify	Same process, self-service

4. Facebook login — what matters

You are **currently logged into Facebook**. That is useful now. You plan to **close the account after removal** — that is the correct order.

Works without Facebook login

- Email **privacy@facebook.com** with GDPR letters
- Meta escalation form: <https://www.facebook.com/help/contact/571927962827151>
- Regulator complaint (URL from `jurisdiction.regulator_url` in config)
- Google delisting forms
- All ReclaimKit commands (`campaign` , `monitor` , `daemon` , etc.)

Easier with Facebook login (do these now)

- Confirm the post is still live
- Take fresh screenshots if needed
- Download your Facebook data (Settings > Download your information)
- Save any in-app report reference numbers

After you delete Facebook

- Meta can still process your GDPR request via **email**
- You **cannot** easily check if the post is gone — ask someone still in the group, or wait for Meta's reply
- **Deleting your account does NOT remove the post** — Meta must delete it separately

Recommended order

1. Submit GDPR + escalation (while logged in)
2. Save screenshots and Meta reply emails locally
3. Wait up to 1 month for Meta
4. Confirm removal (check yourself or ask someone in the group)
5. Google delisting if anything still appears in search
6. THEN delete/deactivate Facebook
7. Keep monitoring 3–6 months via ReclaimKit (no Facebook needed)

5. Install ReclaimKit

Option A — Local (quickest to start)

```
git clone https://github.com/tgollogly/ReclaimKit.git ~/reclaimkit
cd ~/reclaimkit
pip install -r requirements.txt
python3 main.py init
```

This creates `config.yaml` from the template and `evidence/screenshots/` folder.

Option B — VPS with Docker (set-and-forget monitoring)

See [Section 13](#) and `deploy/README.md` .

Verify installation

```
python3 main.py doctor           # health check
python3 -m pytest tests/ -v      # run test suite (20 tests)
```

6. Configure your case

Edit `config.yaml` (never commit this file — it contains personal details).

If you created `config.yaml` before the latest update, copy new fields from `config.example.yaml` — especially `case.facebook.meta_reports` and `preferences` .

Subject block — fill with your real details

```
subject:
  full_name: "Your Full Name"
  email: "your.email@example.com"
  phone: "+1 555 0100"
  address_line1: "Your street address"
  city: "Your city"
  region: ""           # state/province — optional
  postcode: "12345"
  country: "Your country"
```

Case block — copy from config.example.yaml and edit

```

case:
  facebook:
    group_name: "Example Community Group"
    post_date: "2025-06-05"
    post_caption: "Example caption text"
    post_url: "https://www.facebook.com/groups/EXAMPLE/posts/EXAMPLE/"
    post_origin: uncertain # uncertain | third_party | self – see section 24
    reported_to_meta: true
    meta_reports:
      - type: "In-app content report (photo/post)"
        date: "2026-01-01"
        outcome: "Rejected – does not violate Community Standards"
        notes: "Attach Meta support screenshot"
      - type: "Group report"
        date: "2026-01-01"
        outcome: "Submitted"

```

Letters automatically cite these reports and explain why a Community Standards rejection does **not** answer a GDPR request.

Optional harm statement

```

case:
  harm_statement: >
    Optional custom paragraph describing impact on you. If omitted, letters use
    a strong default harm/distress paragraph.

```

Preferences

```

preferences:
  no_police: true
  closing_platform_after_removal: true

```

Evidence folders

```

evidence:
  screenshots_dir: "./evidence/screenshots"
  output_dir: "./output"

```

Add screenshots

Copy your Facebook screenshots into `evidence/screenshots/` :

- Full post view (photo + caption visible)
- Each harmful comment (scroll and capture)
- Meta report confirmation screen
- **Meta “We didn’t remove the photo” support message (important for Round 1)**

Supported formats: PNG, JPG, JPEG, WEBP.

Secrets (VPS only — use environment variables)

Copy `.env.example` to `.env` :

```

RECLAIMKIT SMTP_PASSWORD= # Gmail app password if auto-email enabled
RECLAIMKIT SLACK_WEBHOOK= # Slack incoming webhook URL
RECLAIMKIT SERPAPI_KEY= # Optional image search
RECLAIMKIT TINEYE_KEY= # Optional image search

```

Never put passwords in `config.yaml` on a VPS. Use `.env` instead.

7. Day 1 — start the campaign

Run these commands in order:

```
# 1. Build evidence pack (hashed screenshots + summary)
python3 main.py evidence

# 2. Start campaign and generate Round 1 letters
python3 main.py campaign init

# 3. Check everything looks correct
python3 main.py doctor
python3 main.py campaign status
```

Or run everything in one go:

```
python3 main.py all
```

What gets created

```
output/
  campaign/
    state.json                      (tracks your progress)
  campaign-package-YYYYMMDD.../
    README.txt
    round-01-meta/
      meta_r1_erasure_initial.txt    (EMAIL THIS TO META)
      SUBMIT.txt                    (step-by-step instructions)
    round-01-google/
      google_r1_removal.txt
      SUBMIT.txt
  evidence-pack-YYYYMMDD.../        (attach to emails if needed)
```

Each letter includes a **case reference** like `RK-ER-YOURNAME-META-R1` (generated from your name in config). Always put this in the email subject line.

8. How to send Round 1 to Meta

This is the **most important step**. It starts the legal response clock for your jurisdiction.

Step-by-step

1. Open `output/campaign-package-.../round-01-meta/meta_r1_erasure_initial.txt`
2. Open your email client (Gmail, Outlook, etc.)
3. **To:** `privacy@facebook.com`
4. **CC (optional):** `dpo@facebook.com`
5. **Subject:** `RK-ER-YOURNAME-META-R1 – Article 17 Erasure Request – Your Full Name`
6. **Body:** Paste the entire letter
7. **Attachments:** All screenshots from `evidence/screenshots/`
8. Send from the **same email address** listed in `config.yaml`
9. Record submission in ReclaimKit:

```
python3 main.py campaign sent --track meta --round 1
```

Tips for a strong submission

- Send from your real email — Meta may reply asking for verification
- Attach clear screenshots showing your face, name, and harmful comments
- Keep a copy of the sent email in a folder (or export to PDF)

- Do **not** send your passport unless Meta explicitly asks in a reply

If you already reported in-app

Round 1 mentions your prior report. Meta sometimes treats GDPR as a separate, stronger legal obligation — send it anyway.

9. Campaign tracks and timeline

ReclaimKit runs three parallel **tracks**. Meta is the priority.

Meta track — 6 rounds

Round	Letter	When to send
R1	GDPR Article 17 initial request	Day 1 — send today
R2	GDPR reminder (no response)	7+ days after R1 with no removal
R3	Trust & Safety escalation	7+ days after R2, or if refused
R4	Formal rebuttal to refusal	When Meta refuses with a reason
R5	Notice of intended regulator complaint	After <code>response_days</code> with no removal
R6	Post-regulator follow-up to Meta	After regulator accepts complaint

Generate next round automatically:

```
# No response after 7 days
python3 main.py campaign no-response --track meta

# Meta refused — include their reason
python3 main.py campaign refused --track meta --reason "They said it doesn't violate community standards"

# Manually generate a specific round
python3 main.py campaign next --track meta --round 3
```

Round 3+ also submit the escalation form:

<https://www.facebook.com/help/contact/571927962827151>

(No Facebook login required for this form.)

Recording submissions

Every time you send a letter or submit a form:

```
python3 main.py campaign sent --track meta --round 2
python3 main.py campaign sent --track google --round 1
python3 main.py campaign sent --track regulator --round 1 --reference REG-REF-12345
```

Check progress anytime

```
python3 main.py campaign status
```

Mark success

When the post and comments are gone:

```
python3 main.py campaign success --note "Post removed confirmed 2026-08-XX"
python3 main.py close # prints Facebook closure checklist
```

10. Google delisting (parallel track)

Google removal **hides content from search** — it does not delete the Facebook post. Run this **in parallel** with Meta, especially if your name or photo appears in Google results.

Round 1 — Defamation

1. Open `output/campaign-package-.../round-01-google/google_r1_removal.txt`
2. Follow the URL in the letter header (Google Legal Troubleshooter)
3. Paste relevant sections into the form
4. Record: `python3 main.py campaign sent --track google --round 1`

Additional Google tools

Tool	URL	Use when
Defamation troubleshooter	https://support.google.com/legal/troubleshooter/1114905	False allegations in search snippets
Personal info removal	https://support.google.com/websearch/contact/content_removal_form	Photo, address, phone in results
Results About You	https://myactivity.google.com/results-about-you	Ongoing alerts for new mentions

Monitor for new URLs

```
python3 main.py monitor
```

Reports save to `output/search-monitor-*.txt` and `.json`. Submit delisting for any harmful URLs found.

Google forms are manual (~2 minutes each) — ReclaimKit drafts the text; you paste it in.

11. Regulator complaint (if Meta refuses)

If Meta does not remove content within the deadline set in `jurisdiction.response_days`, or explicitly refuses your erasure request, escalate to your **data protection authority** — free, no police, no court.

When to file

- Response deadline passed since Round 1 with no removal
- Meta sent a refusal citing “community standards” or similar
- After Meta Round 4 (rebuttal) failed

How to file

1. Generate regulator letter: `python3 main.py campaign next --track regulator`
2. Go to the URL in `jurisdiction.regulator_url` in your config
3. Attach:
 - Evidence pack from `output/evidence-pack-.../`

- All Meta correspondence (your emails + their replies)
- Screenshots

4. Record: `python3 main.py campaign sent --track regulator --round 1 --reference YOUR-REG-REF`

After the regulator

- The authority may contact Meta on your behalf
- Send Meta Round 5 (regulator notice) when you file
- Send Meta Round 6 after the regulator acknowledges the complaint

12. Closing Facebook after removal

Do NOT delete Facebook until removal is confirmed or you have exhausted the privacy/regulator path.

Run the built-in checklist:

```
python3 main.py close
```

Before deleting your account

- ☐ Download your data: Settings > Download your information
- ☐ Save all Meta reply emails locally
- ☐ Save evidence pack and campaign letters from `output/`
- ☐ Remove apps connected to Facebook (Settings > Apps and websites)
- ☐ Update logins on sites where you used “Log in with Facebook”
- ☐ Confirm post is gone (check while still logged in, or ask someone in the group)

Deactivate vs delete

Action	Effect
Deactivate	Profile hidden; reversible for 30 days
Delete permanently	Cannot log back in; data scheduled for deletion

Path: Settings and privacy > Settings > Accounts Centre > Personal details > Account ownership and control > Deactivation or deletion

After Facebook is closed

- Continue `python3 main.py monitor` monthly for 3-6 months
- Re-submit Google delisting if new URLs appear
- Meta GDPR follow-up still works via email to `privacy@facebook.com`

13. Daily monitoring and VPS automation

Optional but recommended if you want hands-off daily checks (~£5/month VPS).

What runs automatically (Docker or cron)

Task	Frequency
Web search for your name	Daily
Reverse image search (if API key set)	Daily
Slack alert on new harmful URLs	When found
Auto-generate next Meta letter after 7 days silence	If enabled
Auto-email Meta	Optional (auto_send_emails: true)

Docker quick start

```
cd deploy
docker compose up -d --build
```

Logs: `output/cron.log` and `output/automation-log.jsonl`

Cron (no Docker)

```
0 8 * * * cd /path/to/reclaimkit && python3 main.py daemon once >> output/cron.log 2>&1
```

Test automation without sending

```
python3 main.py daemon once --dry-run
```

Slack setup

1. Create incoming webhook: `https://api.slack.com/messaging/webhooks`
2. Add URL to `config.yaml` under `automation.slack_webhook_url`
3. Or set `RECLAIMKIT_SLACK_WEBHOOK` in `.env`

Full VPS details: `deploy/README.md`

14. All CLI commands reference

Command	Purpose
<code>python3 main.py init</code>	Create <code>config.yaml</code> and evidence folders
<code>python3 main.py evidence</code>	Build hashed evidence pack
<code>python3 main.py letters</code>	Generate standalone takedown letters (non-campaign)
<code>python3 main.py campaign init</code>	Start campaign + Round 1 package
<code>python3 main.py campaign status</code>	Show progress dashboard
<code>python3 main.py campaign sent --track meta --round N</code>	Record submission
<code>python3 main.py campaign no-response --track meta</code>	7-day silence, then next round
<code>python3 main.py campaign refused --track meta --reason "..."</code>	Refusal, then rebuttal letter
<code>python3 main.py campaign next --track meta --round N</code>	Generate specific round
<code>python3 main.py campaign success</code>	Mark content removed
<code>python3 main.py monitor</code>	Scan search for indexed URLs
<code>python3 main.py osint</code>	Document commenter handles
<code>python3 main.py guide</code>	Print removal action guide
<code>python3 main.py close</code>	Facebook closure checklist
<code>python3 main.py doctor</code>	Validate config, deps, letters
<code>python3 main.py daemon once</code>	Run daily automation cycle
<code>python3 main.py daemon once --dry-run</code>	Test without writes/emails
<code>python3 main.py all</code>	Evidence + campaign + osint + monitor

Global option: `--config path/to/config.yaml` (default: `config.yaml`)

15. Windows 11 setup (Docker + WSL)

ReclaimKit is Python and runs best on **WSL2** (Windows Subsystem for Linux). Docker Desktop integrates with WSL.

Step 1 — Install WSL2

Open PowerShell as Administrator:

```
wsl --install
```

Restart if prompted. Ubuntu is the default distribution.

Step 2 — Install Docker Desktop

1. Download from <https://www.docker.com/products/docker-desktop/>
2. Install and enable **WSL 2 backend** in Settings > General
3. Enable integration with your Ubuntu distro in Settings > Resources > WSL Integration

Step 3 — Clone and run in WSL

Open Ubuntu (WSL terminal):

```
sudo apt update && sudo apt install -y python3 python3-pip git
git clone https://github.com/tgollogly/ReclaimKit.git ~/reclaimkit
cd ~/reclaimkit
pip install -r requirements.txt
python3 main.py init
# Edit config.yaml with: nano config.yaml
# Add screenshots to evidence/screenshots/
python3 main.py campaign init
python3 main.py doctor
```

Step 4 — Optional VPS-style Docker monitoring

From WSL, inside the repo:

```
cd deploy
docker compose up -d --build
docker compose logs -f
```

Accessing files from Windows

WSL files live at `\\wsl$\\Ubuntu\\home\\<username>\\reclaimkit\\` in File Explorer. You can copy screenshots there directly.

Testing on Windows (no VPS)

You do **not** need Docker for the core workflow. Local Python in WSL is enough:

```
python3 main.py campaign init
# Email Meta manually using the generated letter
python3 main.py campaign sent --track meta --round 1
python3 main.py monitor
```

16. Costs and comparison to paid services

Option	Cost	Notes
ReclaimKit (local)	£0	Your time only
VPS monitoring	~£5/month	Hetzner, DigitalOcean, etc.
SerpAPI (image search)	~\$50/month free tier available	Optional
Removify	£400-£2,000 per item	Same forms and emails
Solicitor	Varies	Only if platform + regulator both fail

ReclaimKit automates what paid services do manually: letter drafting, escalation timing, monitoring, and record-keeping.

17. FAQ

Do I need my Facebook password?

Not for the removal process. GDPR runs on your email and postal address. Login helps you check the post and

take screenshots now, but follow-up works without it.

Do I need to send my passport?

Not in Round 1. Meta may ask for ID in a reply email to verify you are the data subject. Only send if they request it.

I already reported the post in-app. Do I still send GDPR?

Yes. In-app reports and GDPR Article 17 requests are different channels. GDPR creates a legal deadline Meta must meet.

Will deleting Facebook remove the post?

No. The post must be removed by Meta while your request is active. Close your account **after** removal.

Can this hurt my US travel or create a public record?

This process is **private correspondence** with Meta/Google/your regulator — not a public court case or police record. Google delisting **reduces** public visibility. Avoid posting about the case on public blogs (higher SEO risk than a private group).

Can ReclaimKit identify who posted the comments?

No. Anonymous Facebook handles cannot be deanonymized without Meta legal disclosure. Focus on **content removal**, not confronting individuals.

What if Meta says “doesn’t violate community standards”?

Record the refusal and generate Round 4 (rebuttal):

```
python3 main.py campaign refused --track meta --reason "Pasted Meta's exact reply here"
```

Then proceed toward a regulator complaint if still not removed after the response deadline.

How long does it take?

Stage	Typical timeframe
Meta privacy response	Up to <code>jurisdiction.response_days</code> (often 30 days)
Google delisting	Days to weeks
Regulator complaint	Weeks to months
Full campaign	1-3 months in most cases

18. Troubleshooting

Run the doctor (health check — not Docker)

Doctor = validate your setup before sending letters. **Docker** = run daily monitoring on a VPS (section 23).

```
python3 main.py doctor
python3 main.py --config config.example.yaml doctor # validate template
```

Core checks must pass (marked ✓). Warnings (marked !) are items you must fix before emailing Meta — placeholder email, missing screenshots, etc.

Common issues

Problem	Fix
<code>config.yaml</code> not found	Run <code>python3 main.py init</code>
No campaign found	Run <code>python3 main.py campaign init</code>
No screenshots found	Add PNG/JPG files to <code>evidence/screenshots/</code>
Monitor import error	<code>pip install duckduckgo-search</code>
SMTP auto-email fails	Use Gmail App Password, not main password; set <code>RECLAIMKIT_SMTP_PASSWORD</code>
Letters missing your name	Edit <code>config.yaml</code> subject block

Run tests

```
python3 -m pytest tests/ -v
```

All 20 tests should pass.

Run the full audit script:

```
chmod +x scripts/audit.sh
./scripts/audit.sh
```

19. Support contacts

Service	Contact	Use for
Your data protection authority	URL in <code>jurisdiction.regulator_url</code>	Platform privacy failures
Meta DPO	<code>privacy@facebook.com</code> , <code>dpo@facebook.com</code>	Data erasure requests

Set `jurisdiction.regulator_name` and `jurisdiction.regulator_url` in config for your country. Solicitors remain optional if the platform and regulator both fail.

20. Checklist — print and tick off

Phase 1 — Setup (Day 1)

- ☐ Clone repo and run `pip install -r requirements.txt`
- ☐ Run `python3 main.py init`
- ☐ Fill real email, address, phone in `config.yaml`
- ☐ Copy screenshots to `evidence/screenshots/`
- ☐ Run `python3 main.py evidence`
- ☐ Run `python3 main.py campaign init`
- ☐ Run `python3 main.py doctor` (all checks green)

Phase 2 — Meta removal (Week 1)

- ☐ Email Round 1 letter to `privacy@facebook.com`
- ☐ Subject line includes your case reference from the generated letter (e.g. `RK-ER-YOURNAME-META-R1`)
- ☐ Attach all screenshots

- ☐ Run `python3 main.py campaign sent --track meta --round 1`
- ☐ Save sent email and any Meta reply

Phase 3 — Google (parallel)

- ☐ Run `python3 main.py monitor`
- ☐ Submit Google Round 1 if URLs found
- ☐ Enable Results About You on Google account
- ☐ Run `python3 main.py campaign sent --track google --round 1`

Phase 4 — Follow-up (Weeks 2-4)

- ☐ If no removal in 7 days: `campaign no-response --track meta`
- ☐ If Meta refuses: `campaign refused --track meta --reason "..."`
- ☐ Round 3+: submit escalation form at facebook.com/help/contact/571927962827151
- ☐ If response deadline passes: regulator complaint + Meta Round 5

Phase 5 — After removal

- ☐ Confirm post gone (while logged in or via someone in group)
- ☐ Run `python3 main.py campaign success`
- ☐ Download Facebook data
- ☐ Run `python3 main.py close` and follow checklist
- ☐ Delete/deactivate Facebook account
- ☐ Monitor monthly 3-6 months: `python3 main.py monitor`

21. Community Standards vs GDPR

These are **two different doors** into Meta. ReclaimKit is built for the legal one.

	Community Standards (Report button)	Privacy erasure request (privacy@facebook.com)
Question	Does this break Meta's house rules?	Must you delete my personal data?
Team	Content moderation	Data protection / privacy
Deadline	None	Set by your jurisdiction (often 30 days)
Your outcome	Rejected ("no violation")	Still pending until DPO responds
Bullying/harm	Often dismissed as "discussion"	Harm supports erasure + distress

Bullying is harmful. Meta's rejection only means their moderation system did not classify it as a policy breach. Applicable privacy law still covers your photo, name, and comments about you.

22. Meta rejected your report — what now

If you received: *"We didn't remove the photo" / "doesn't go against Community Standards"*:

1. **Save a screenshot** to `evidence/screenshots/`
2. Add under `case.facebook.meta_reports` in `config.yaml` (see `config.example.yaml`)
3. **Send GDPR Round 1 anyway** — the letter now cites the rejection explicitly
4. Record refusal:

```
python3 main.py campaign refused --track meta --reason "In-app report rejected: does not violate Community Standards (12 Aug 2026)"
```

5. Attach the rejection screenshot to every Meta email

Paid removal firms see this rejection daily. Their next step is always **GDPR to privacy@facebook.com** — same as you.

23. Docker — does it auto-save?

Not the same as doctor : **Docker** runs ReclaimKit on a VPS in the background. `python3 main.py doctor` is a separate health-check command (config, screenshots, letters). See [section 18](#) for `doctor`.

Yes. Docker does not lose your campaign when the container restarts.

These folders are **mounted from your PC/VPS** (not stored only inside the container):

Host path	What is saved
output/	Campaign state, letters, monitor reports, automation logs
output/campaign/state.json	Round tracking (campaign sent , etc.)
output/automation-log.jsonl	Daily daemon history
evidence/	Screenshots and evidence packs

From `deploy/docker-compose.yml` :

```
volumes:
  - ../config.yaml:/app/config.yaml:ro
  - ../evidence:/app/evidence
  - ../output:/app/output
```

What persists automatically when daemon once runs:

- Updated `state.json` after escalation
- New monitor JSON reports
- `seen_urls.json` (URLs already alerted)
- Appended lines in `automation-log.jsonl`

What is NOT automatic:

- Sending Round 1 initially (you run `campaign init` once)
- Recording `campaign sent` unless you run the command (or auto-email sends)
- Google form submission (always manual)

Safe workflow:

```
python3 main.py campaign init
python3 main.py campaign sent --track meta --round 1
cd deploy && docker compose up -d --build
```

If the container is deleted and recreated, **your data remains** in `output/` and `evidence/` on the host.

24. Unsure who posted? (safe wording)

You can still remove everything. Applicable privacy law protects **your data** — not only cases where someone

else posted.

If you do not remember whether you posted the caption yourself (e.g. after drinking, testing the group), use:

```
case:
  facebook:
    post_origin: uncertain # DEFAULT – safest
```

Value	When to use
uncertain	You are not sure who created the post — use this if in any doubt
third_party	You are certain someone else posted your photo/name
self	You posted it and want all data + comments removed

uncertain letters say: - You request erasure of your photo, name, and comments - You do **not** consent to continued processing - **Without claiming** someone else definitely posted - **Without admitting** you posted — legally neutral

You are **not** required to tell Meta you might have posted drunk. Do **not** lie if they ask directly later.

The harmful **comments** are still from other people — erasing those protects you regardless of who wrote the caption.

25. Job hunting — will this hurt you?

Risk	Level	Notes
Private group post	Medium	Not on Google for everyone, but group members see it
Google search for your name	Medium-High	If indexed, employers <i>may</i> find it — run <code>python3 main.py monitor</code>
Niche community groups	Low	Most recruiters do not search specific groups by name
After Meta removal + Google delist	Low	Source gone + search hidden = much safer

What helps job hunting: 1. Remove source (Meta privacy request) — **do this first** 2. Google delisting + **Results About You** alerts 3. Do **not** post about the case publicly (creates new SEO) 4. LinkedIn/CV focus on skills — most employers check LinkedIn, not niche groups

Reality: Until removed, there is **some** risk if someone Googles you. After removal and delisting (typically 1–3 months), risk drops sharply. This is **not** a criminal record or court case — it does not appear on standard employment checks.

26. How long until content is erased?

Stage	Typical time	What happens
Send privacy Round 1	Day 1 (today)	Clock starts — platform has until <code>response_days</code> to respond
Meta removes post	1-4 weeks	Many cases resolve Round 1-3
Meta refuses / silence	Week 2-4	Escalation rounds + regulator
Regulator complaint	Week 4-8+	Free authority pressure
Google delisting	1-4 weeks after submit	Hides from search (parallel track)
Google cache clears	Days-weeks after delist	Old snippets may linger briefly
Full campaign	1-3 months typical	Complex refusals take longer

Private group posts are often **not indexed** by Google — but run monitor to check.

There is **no instant delete** — Meta has up to one month by law. ReclaimKit automates follow-up so you do not pay £400+ for someone else to send the same emails.

27. Cheap VPS for automation + free AI

Full guide: [deploy/VPS-GUIDE.md](#)

Provider	Cost	Recommendation
Hetzner CX22	~£4.50/mo	Best value — 4 GB RAM, EU servers, runs Docker + ReclaimKit
DigitalOcean	~\$6/mo	Easy for beginners
Oracle Cloud Free	£0	Powerful if you get approved — setup harder

One VPS can run: - ReclaimKit daily monitor (this repo) - **Ollama** — free local AI (Llama, Mistral) - n8n, Uptime Kuma, VPN, other scripts

```
cd deploy && docker compose up -d --build
```

Data **auto-saves** to `output/` on the host — see section 23.
